

Status of CSC Alignment

Jim Pivarski

Texas A&M University

15 March, 2010

How CSC alignment fits together

Jim Pivarski

2/19

for (1) short-term and (2) long-term ($\gtrsim 20 \text{ pb}^{-1}$)

hardware alignment system:

(1) check system with 2D positions of monitored chambers

(1 & 2) provide all Z positions and angles

Outline for this talk

- ▶ Status of hardware alignment
- ▶ Next steps, simulated in MC
- ▶ Beam-halo and CSC overlaps
- ▶ Infrastructure development

- ▶ Usable datasets in CRAFT-09 and 2010
 - ▶ CRAFT-09: can cross-check with cosmics
 - ▶ 2010: can cross-check with beam-halo
 - ▶ producing initial set of alignment constants for 2010

Straight line monitors

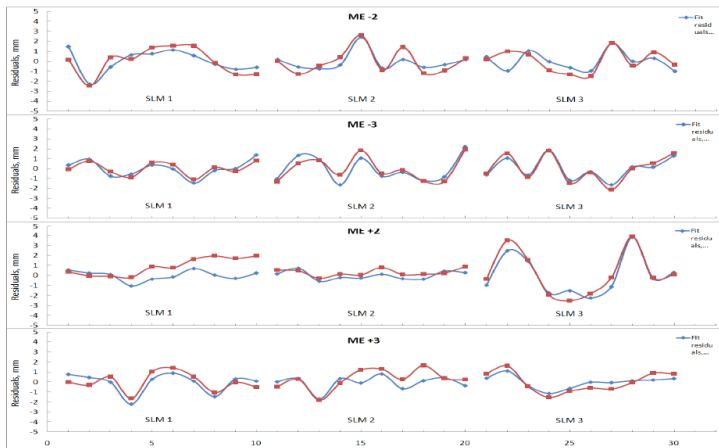

- ▶ Fits-by-hand show better agreement with photogrammetry
 - ▶ used to debug COCOA models
- ▶ DCOPS measure $r\phi$ and z equally; tracks only measure $r\phi$ well

Transfer lines and z-bars

- ▶ Internal closure checks are in good agreement
- ▶ Also checking with fits-by-hand

R- ϕ Hand Fit Residuals (offsets) for SLM Lines ME+/-2,3, B = 0

Agreement between hand fit and PG data is about 0.5 mm

PG data is good enough to validate COCOA fit.

Correlation and Resolution

Oleg Prokofiev

- ▶ Accounting for $\sigma_{PG} = 300 \text{ } \mu\text{m}$, DCOPS accuracy is $500 \text{ } \mu\text{m}$
- ▶ We know that the hardware is producing good data and that the photogrammetry (2007) is still relevant

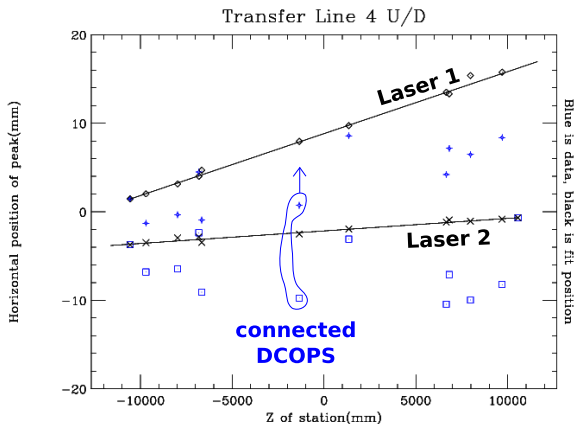

- Workflow complete; needs to incorporate updates from transfer lines and corrections to COCOA model

- ▶ Two laser measurements in each station agree
- ▶ Checking closure test from endpoint photogrammetry
- ▶ Also testing COCOA fits against by-hand fits (by-hand fit below)

Beam-halo data!

Jim Pivarski 8/19

- ▶ About 1 million events in 40 minutes
- ▶ Distribution of beam-halo used in CSC-Overlaps alignment

In more detail...

Jim Pivarski 9/19

► Divided up by station

► Some overlaps are missing

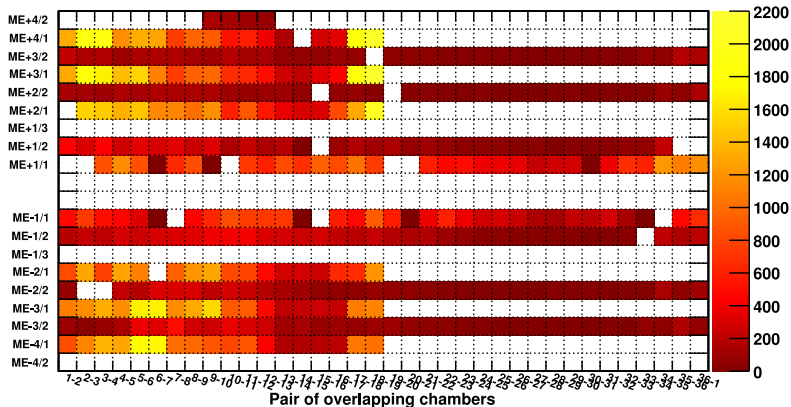

► R vs. ϕ

► Innermost radius set by track-reconstruction requirements

Missing overlaps

Jim Pivarski 10/19

- ▶ 4 complete rings, 6 “almost complete” rings, out of 15
 - ▶ “almost”: only one gap, which we can fill by *assuming* closure

- ▶ 4 complete rings, 6 “almost complete” rings, out of 15
 - ▶ “almost”: only one gap, which we can fill by *assuming* closure
- ▶ Most of the problems are edge CFEBs (1 or 5)

- Closure per chamber = $\frac{1}{N} \sum_i^N \Delta(r\phi)_i - \Delta(r\phi)_{i+1}$ $N = 18 \text{ or } 36$
- independent of alignment
 - can only be computed for complete rings
 - non-zero value interferes with alignment of incomplete rings

	2008	2010
ME+3/1		$+298 \pm 9 \mu\text{m}$
ME-2/1	$-40 \pm 23 \mu\text{m}$	
ME-3/1	$-20 \pm 28 \mu\text{m}$	$+486 \pm 9 \mu\text{m}$
ME-3/2		$+572 \pm 27 \mu\text{m}$
ME-4/1		$+440 \pm 10 \mu\text{m}$

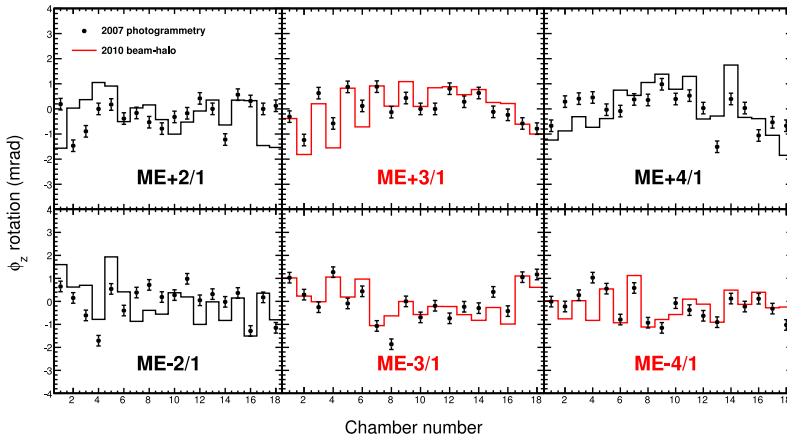

- In 2008, an $800 \mu\text{m}$ effect was caused by a $\sim 10 \mu\text{m}$ error in strip width; this new effect is smaller

- ▶ Complete rings in red are more reliable
- ▶ Incomplete rings have $500 \mu\text{m} \times 17 = 8 \text{ mm}$ errors at the location of the gap that is filled-in by assuming zero closure

Inner ring results

Jim Pivarski 14/19

- ▶ Complete rings in red are more reliable
- ▶ Incomplete rings have $500 \mu\text{m} \times 17 = 8 \text{ mm}$ errors at the location of the gap that is filled-in by assuming zero closure

First complete outer-ring

Jim Pivarski 15/19

- Established technique with cosmics; completes endcap alignment with $400\ \mu\text{m}$ accuracy at $5\ \text{pb}^{-1}$ if rings can be aligned internally

- ▶ Alignment of each chamber relative to the tracker individually: does not require complete rings
- ▶ Comparison of CSC-Overlaps against Reference-Target would be a powerful systematics check, even if only in a few rings
- ▶ Aysen Tatarinov (TAMU) is learning the system from the inside out, and solved the problem of Minuit failing in some low-statistics fits

Infrastructure developments Jim Pivarski 18/19

Jim Pivarski 18/19

- ▶ Alignment Quality Monitor, by Vadim Khotilovich
- ▶ Much easier than sifting through thousands of plots!

[illegible]

- ▶ Long-standing issues in hardware alignment reconstruction are being solved
- ▶ Beam-halo run was fruitful
 - ▶ obtained up-to-date constants for 4 rings
 - ▶ discovered a new closure issue
 - ▶ 2007 photogrammetry is still relevant
- ▶ Next steps have all been tested in data and resolution vs. integrated luminosity estimated
- ▶ New alignment group members are becoming well-versed and expanding functionality of the system
